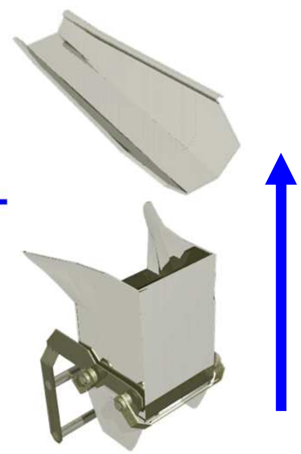
TIMING ADJUST

PH - RF Pool Hopper to Radial Feeder Delay

REFILLING POOL HOPPER

RADIAL FEEDER - START WORKING

POOL HOPPER - START TO OPEN



RECOMMENDED TO NEVER BE SET TO ZERO; as product may drop straight through PH

PH - RF

Pool Hopper to Radial Feeder Delay

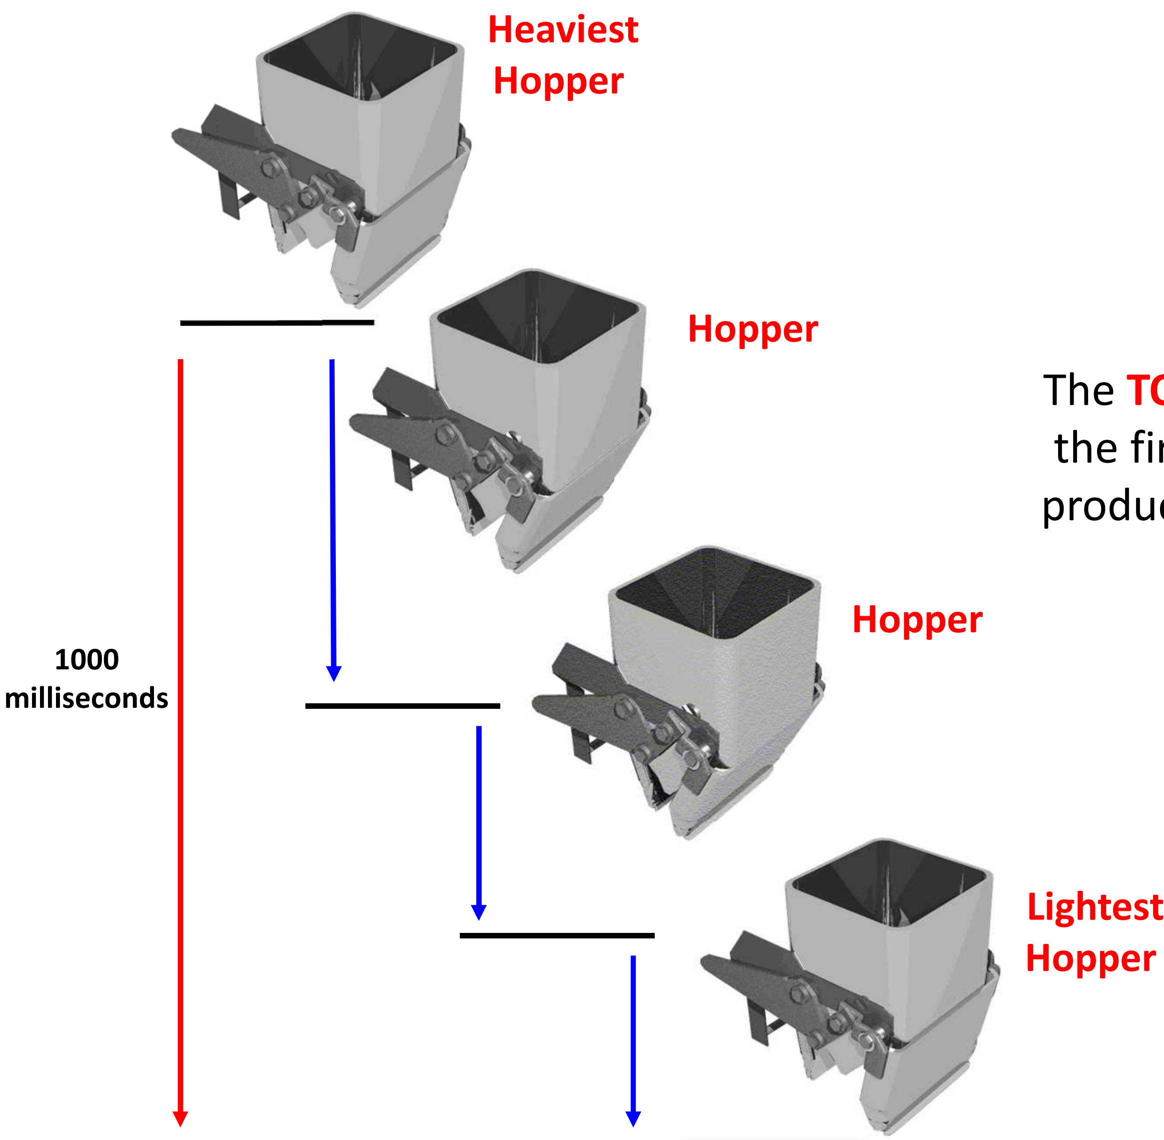
Delays the operation (start) of the Radial Feeders after the Pool Hoppers activates.

Should be set so that the Radial Feeder operate after the Pool Hoppers.

If product from the Radial Feeders is getting caught in the doors of the Pool Hopper, increasing this delay may eventually “cure” the problem.

TIMING ADJUST

Stagger = set to 1000ms



STAGGER

The **TOTAL** time period between when the first hopper (Heaviest) discharges product until the last hopper (Lightest) discharges product.

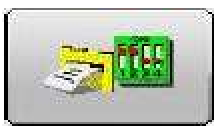
HEAT AND CONTROL

Production
~ Total Data/Histogram

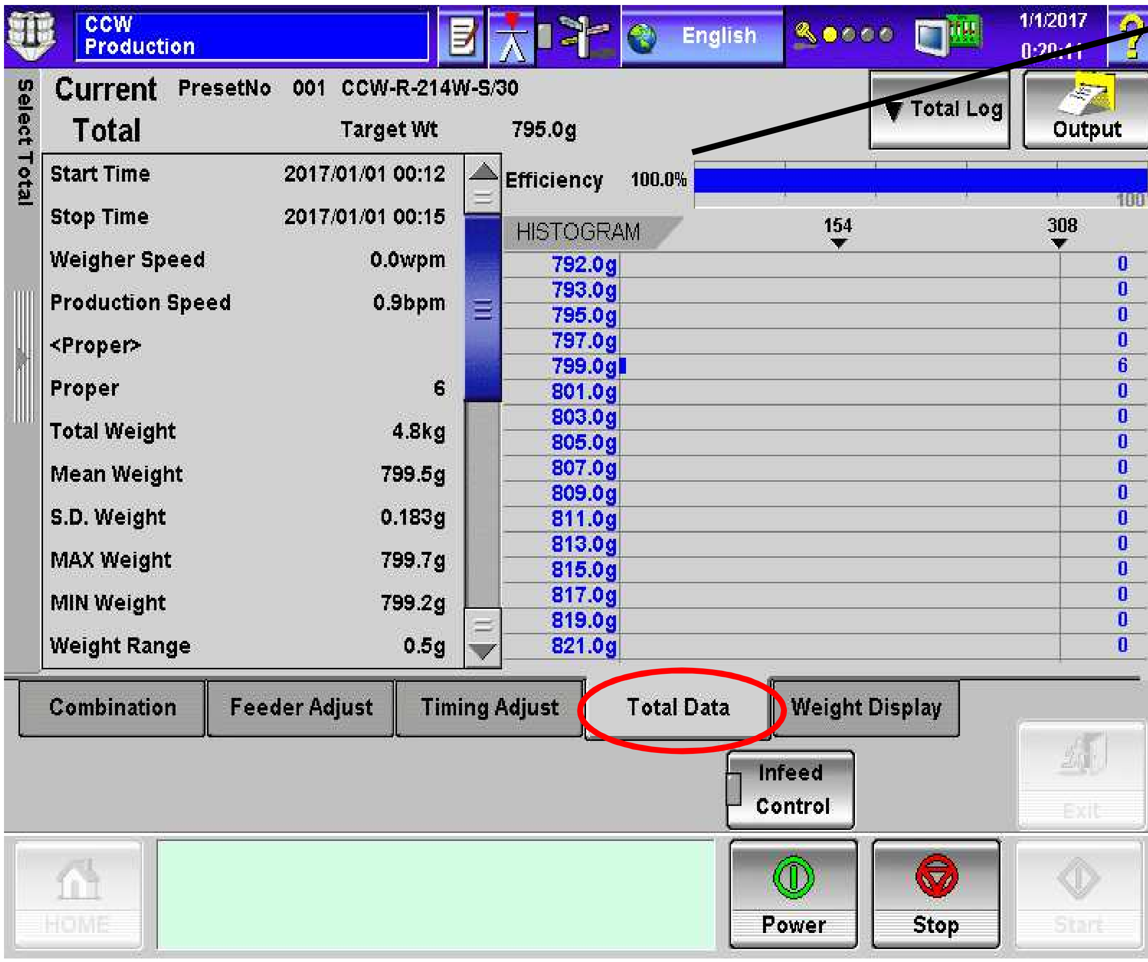
Current Stats

*To clear the statistical information (<u>*must be completed from the Site Engineer level authority or higher*</u>) select the SELECT TOTAL slide out bar. From the selection choose the TOTAL SETTINGS tab. With production in STOP, select the ALL TOTAL Eraser button. <u>*NOTE: Once the statistical information has been cleared, you cannot recall the information.*</u>

Total Settings



All Total



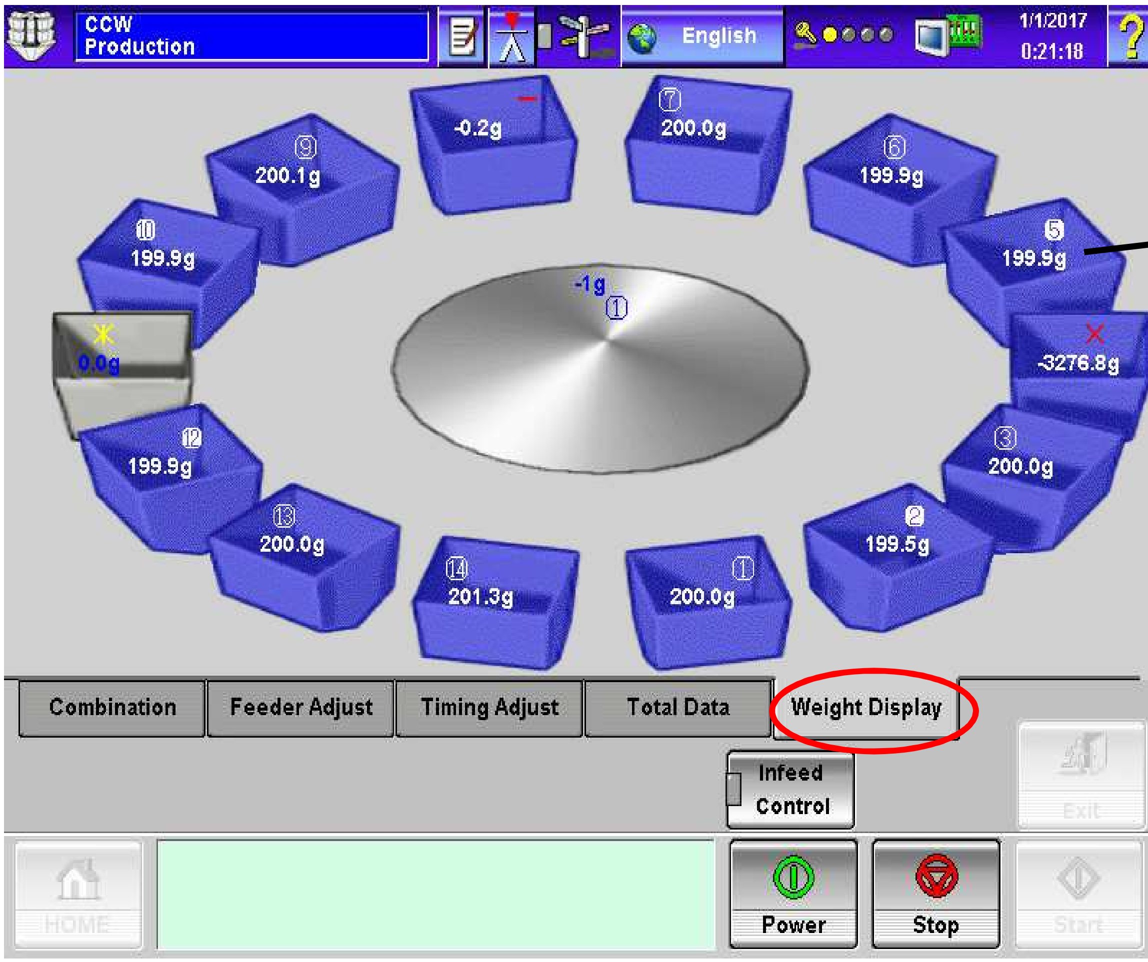
Efficiency

*Represents the amount, in a percentage, of Proper dumps (Discharge Complete - DS) versus "missed" dumps, caused by either Overweight or Underweight.

Histogram

*Represents the amount of Proper combinations and what the weight range of each "dump."

Production
~ Weight Display



Load Cell Weight Data

*Represents the last registered weight in the WH.
NOTE: for the current weight, select Stop, or review at next cycle.

HEAT AND CONTROL

Manual Adjustment

~ Weighing Adjust: Zero Adjust/Span Adjust

Individual Head Selection

NOTE: Span Adjustments is recommended to be completed when:

1. Monthly
2. When new Load Cell installed in WDU
3. Replacement of DUC, DMU, WCU, and/or ADC Board)
4. When Load Cell Range is modified.
5. On WP machine, anytime doors are opened and positive air pressure is released.

Span Adjustment Procedure

1. Select Level Select – Site Engineer (default password 1);
2. Select Machine Set;
3. Select Manual Adjustment;
4. Select the Weigh Hoppers intended to perform Span Adjustment;
5. Select Zero Adjust;
6. Confirm Zero Adjustment +/- .1g (small bucket) +/- .5g (large bucket);
7. Attach Span Weights to Weigh Hoppers;
8. Confirm intended weight on Weigh Hoppers (weight should be within a +/- 25g of intended weight);
9. Select Span Adjust;
10. Confirm intended weight on Weigh Hoppers (weight should be within a +/- .1g (small bucket) +/- .5g (large bucket);
11. Remove Span Weights from Weigh Hoppers;
12. Confirm Zero Adjustment +/- .1g (small bucket) +/- .5g (large bucket);
13. Select Zero Adjust;
14. Confirm Zero Adjustment +/- .1g (small bucket) +/- .5g (large bucket);
15. Exit Manual Adjustment (Span Adjustment) and return to Operator level.

Manual Adjustment
~ Combi. Calcltn

Weigh Data Display Screen

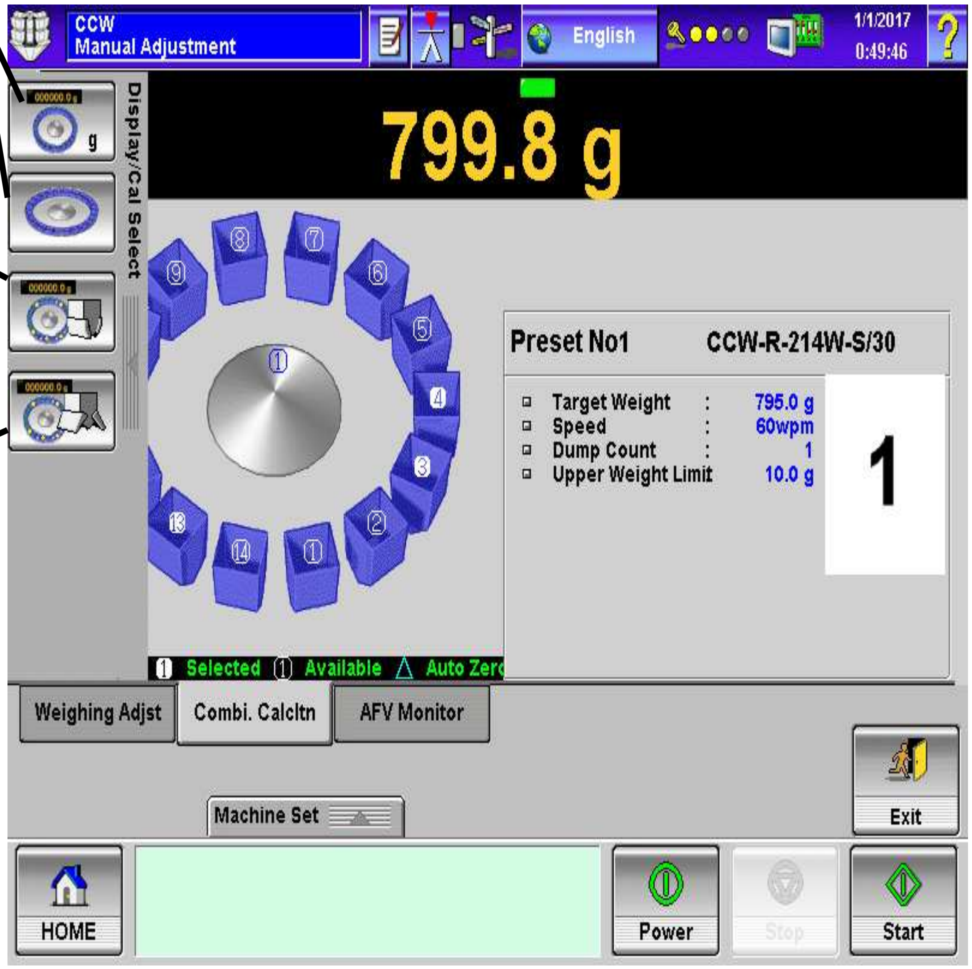
*Can toggle between the two display screens.

Test Combination

*Will perform a combination calculation without opening the Weigh Hoppers. If a proper charge is found, will display the combination in the viewing window.

Test Cycle

*Will perform a combination calculation and will open the Weigh Hoppers. If a proper charge is found, will display the combination in the viewing window and a charge can be collected. If no combination is found, the weigh hoppers will not open and no charge will be collected.

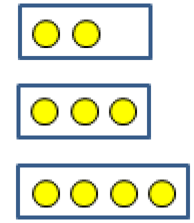


HEAT AND CONTROL

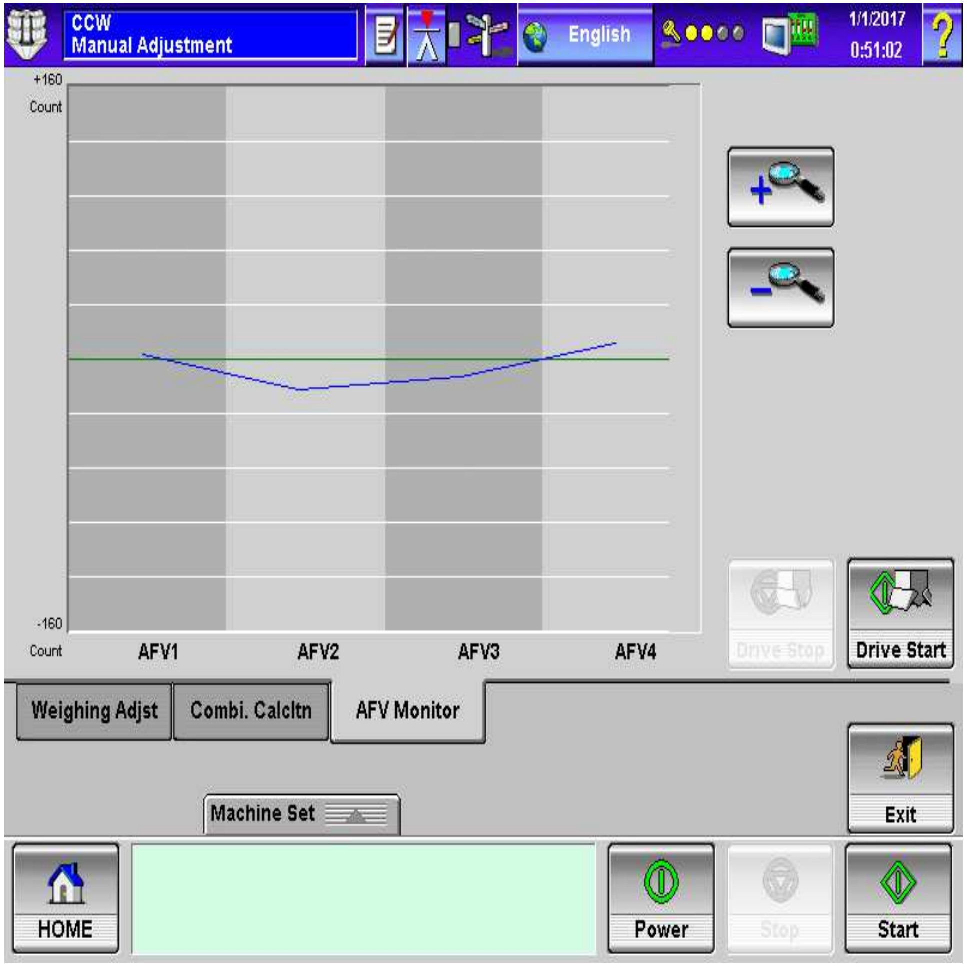
Manual Adjustment

~ AFV Monitor

NOTE: In Display and Data Manager: Layout Setting, selection of this screen can be set to be in either Site Engineer, Installation or Maintenance level.

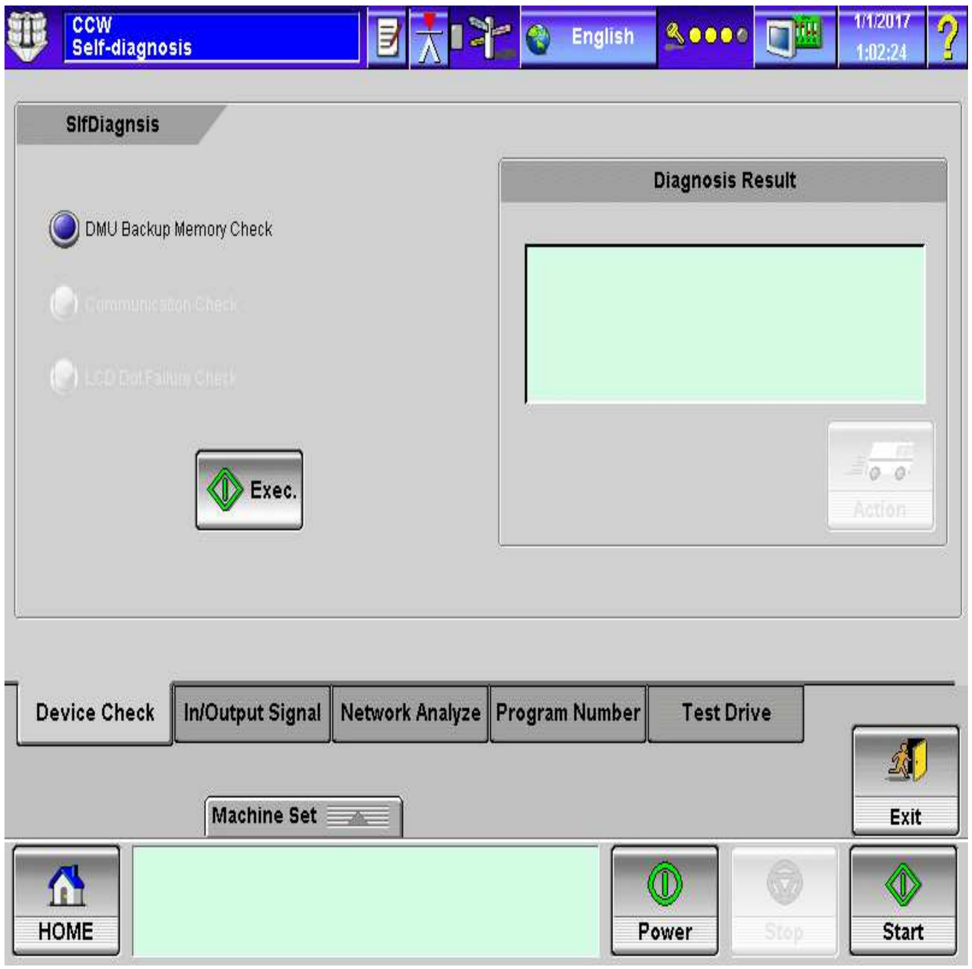


*Monitors the vibrations to the Anti-Floor Vibration load cells.



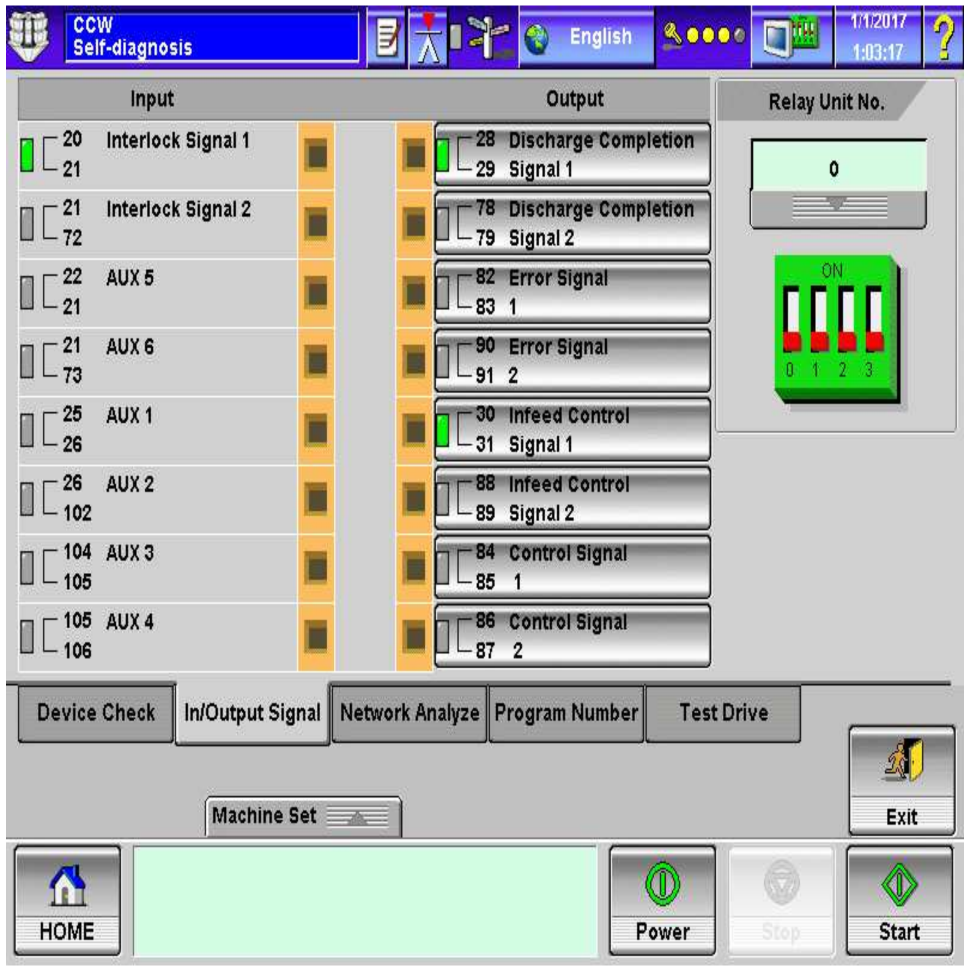
Self Diagnosis
~ Device Check

*Confirms that the DMU backup memory is in working condition.



Self Diagnosis
~ In/Output Signal

*Confirms that the Input and Output signals at the Relay Board.



HEAT AND CONTROL

Self Diagnosis
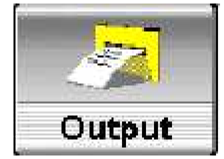
~ Program Number

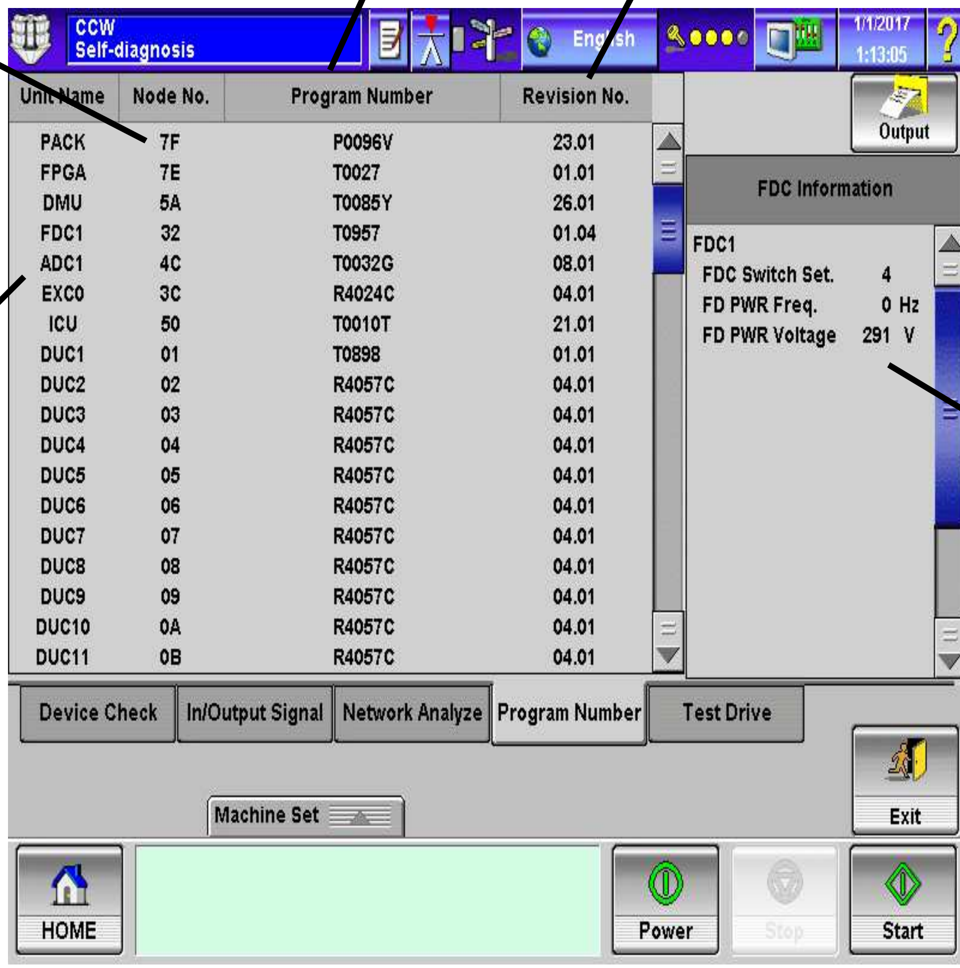


Software No.

Revision No.

Node Number

*Lists the location of the circuit board node for the Network Analyze.



Unit Name

*Lists the name of the circuit boards.

FDRV Voltage

*Represents the voltage present at the Feeder Driver Board. Will only show a value greater than 0.0vDC when the power button has been engaged. *NOTE: In most cases, the FDC Switch should have a Switch Set to 4.*
